1. Introduction

Lifestyle Guru is a browser-based calorie and nutrition tracking application designed to help users manage personal nutrition information in one location. The application allows a user to create an initial profile, review BMI and BMR information, establish daily calorie and macronutrient goals, save foods in a reusable Food Library, log meals, and review nutrition totals for different dates. The Dashboard provides access to the main functions of the application and displays current calorie, protein, carbohydrate, and fat information.

This user guide explains how to access Lifestyle Guru and use its primary features. It provides instructions for logging in, completing profile setup, managing nutrition goals, using the Dashboard, adding and managing Food Library items, logging meals, and reviewing daily nutrition history through the calendar.

2. Accessing Lifestyle Guru

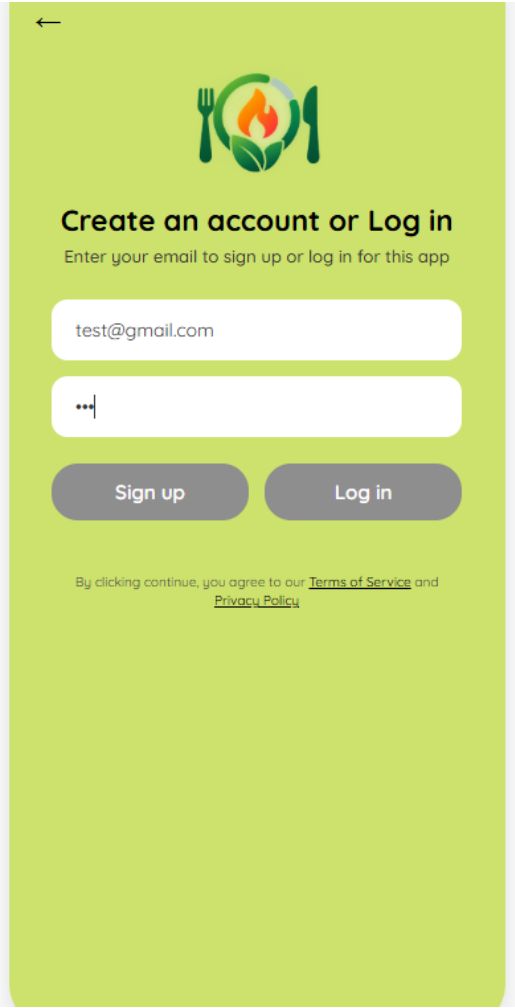

Lifestyle Guru currently operates as a local browser-based prototype. The application must first be running on the computer before it can be accessed through the web browser. Once the application has been started, open a modern browser such as Google Chrome, Microsoft Edge, or Firefox and navigate to:

http://127.0.0.1:5000

The Lifestyle Guru Welcome screen will appear. Select **Continue** to proceed to the account-access screen.

Figure 1. Lifestyle Guru Welcome Screen

Logging In

After selecting Continue, the user is taken to the Login screen. The current prototype uses simplified login validation. Any email address ending in gmail.com can be used with any password to access the application.

If no profile information has been created, the application directs the user through the onboarding process. If a profile already exists, the user proceeds into the main application.

Figure 2. Lifestyle Guru Login Screen

3. Setting Up and Managing a Profile

Lifestyle Guru uses profile information to calculate values used throughout the nutrition-tracking process. During the initial onboarding process, the user provides information such as age, sex or gender, height, weight, activity level, and goal-related information. Each onboarding screen requests one part of the profile and then allows the user to continue to the next step.

To complete the initial setup:

1. Enter the requested information on the first onboarding screen.
2. Select the available **Continue** control.
3. Complete the remaining profile screens for age, sex/gender, height, weight, and activity level.
4. Review the entered information.

5. Continue until profile setup is completed and the application opens the main nutrition-tracking interface.

Height and weight values are converted into the internal measurement format used by the application during initial setup.

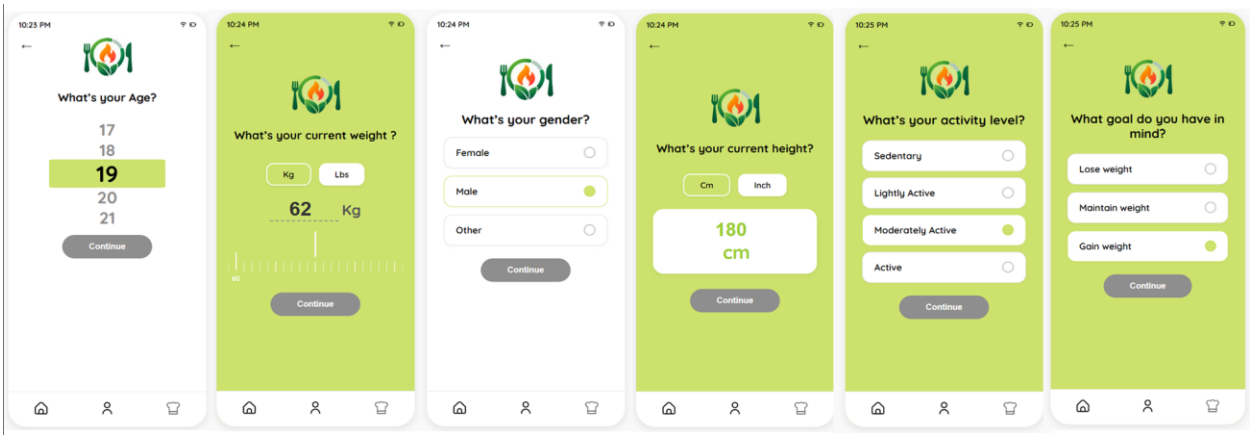

Figure 3. Lifestyle Guru Profile Onboarding

Viewing and Editing the Profile

The active profile can later be opened from the application navigation. The Profile screen displays stored information such as height, weight, sex/gender, activity level, BMI, and BMR.

To update profile information:

1. Open **Profile**.
2. Review the currently stored values.
3. Change the available profile fields as needed.
4. Select **Save**.
5. Review the updated profile information.

BMI and BMR calculations update after the revised profile information is saved rather than changing immediately while the fields are being edited.

The current version of Lifestyle Guru uses one active profile. Multiple-profile selection, additional profile creation, and profile deletion are not included in the current prototype.

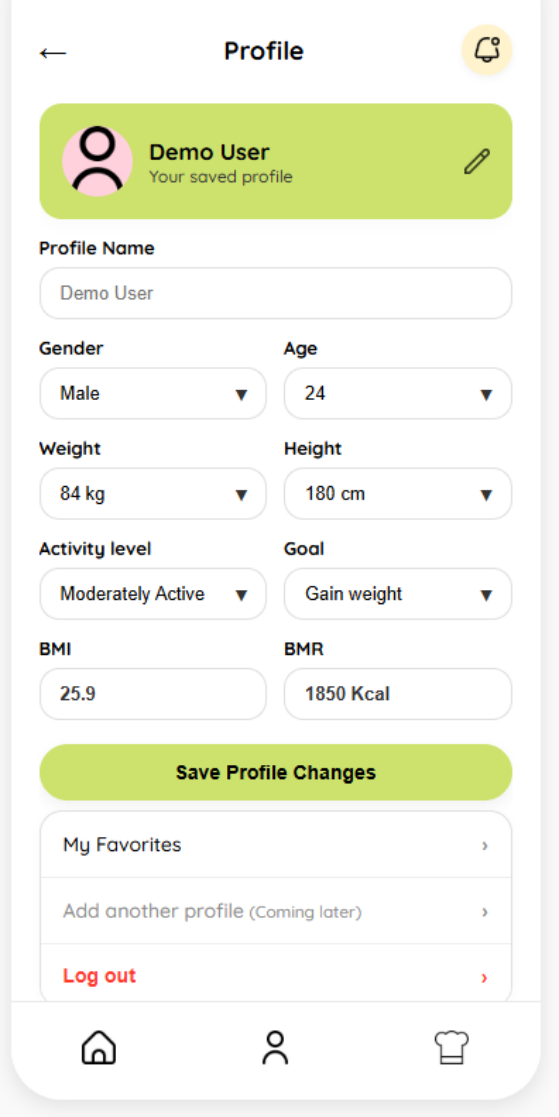

Figure 4. Profile Information

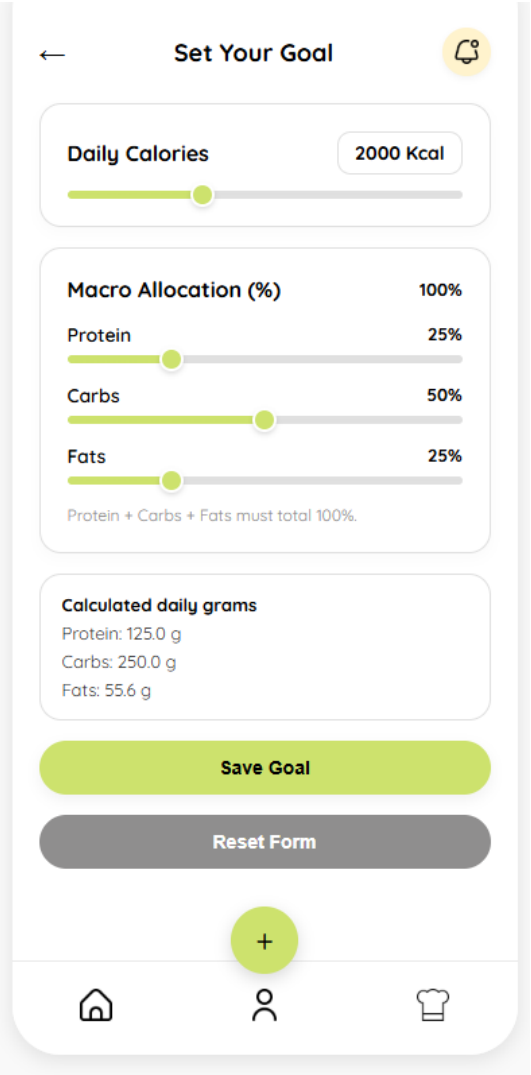

4. Setting Nutrition Goals and Using the Dashboard

Lifestyle Guru allows users to create daily nutrition goals that can later be compared with logged food intake. The goal settings include a daily calorie target and percentages for protein, carbohydrates, and fat. If the protein, carbohydrate, and fat percentages do not total 100%, the application displays a notice and the values must be adjusted before the goal can be saved correctly.

To create or modify nutrition goals:

1. Open the **Goals** screen.
2. Enter or adjust the daily calorie target.

3. Enter the desired percentages for protein, carbohydrates, and fat.

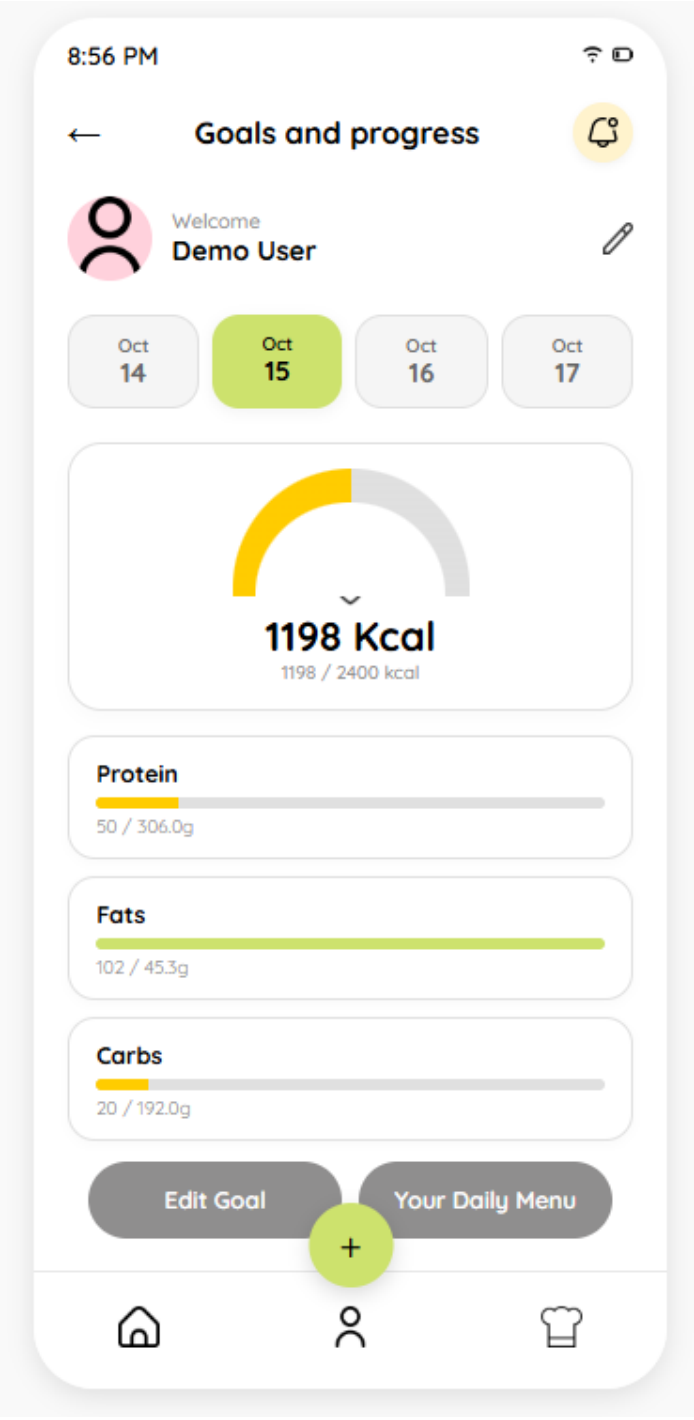

4. Confirm that the three percentages total 100%.
5. Select **Save** to store the new goals.
6. Return to the Dashboard to view the updated targets.

The current version does not use a separate permanent Delete Goal function. Instead, users can reset the goal configuration to the default values of **2,000 calories, 25% protein, 50% carbohydrates, and 25% fat**.

Figure 5. Nutrition Goal Configuration

Dashboard

The Dashboard serves as the main information area for normal use of Lifestyle Guru. It displays the user's current calorie intake and calorie goal along with protein, carbohydrate, and fat totals and targets. It also provides navigation to other parts of the application, including the Profile, Goals, Food Library, meal functions, and calendar-based nutrition information.

As meals are logged, the Dashboard uses the saved nutrition data to update the displayed totals and progress indicators. The calorie and macronutrient progress displays change according to the user's logged nutrition compared with the saved goals.

Figure 6. Lifestyle Guru Dashboard

5. Using the Food Library

The Food Library stores reusable food records so that users do not have to enter the same nutrition information every time they log a meal. Each food item can include a name, meal category, calorie value, protein, carbohydrates, and fat.

To add a new food:

1. Open **Food Library**.
2. Select **Add New Item**.
3. Enter the required food information.
4. Choose the appropriate meal type.
5. Enter the protein, carbohydrate, and fat values. Lifestyle Guru automatically calculates the calorie value based on the entered nutrition information. The calculated calorie value can still be manually edited if necessary.
6. Save the food item.
7. Return to the Food Library and confirm that the new item appears.

Saved foods remain available for future meal logging.

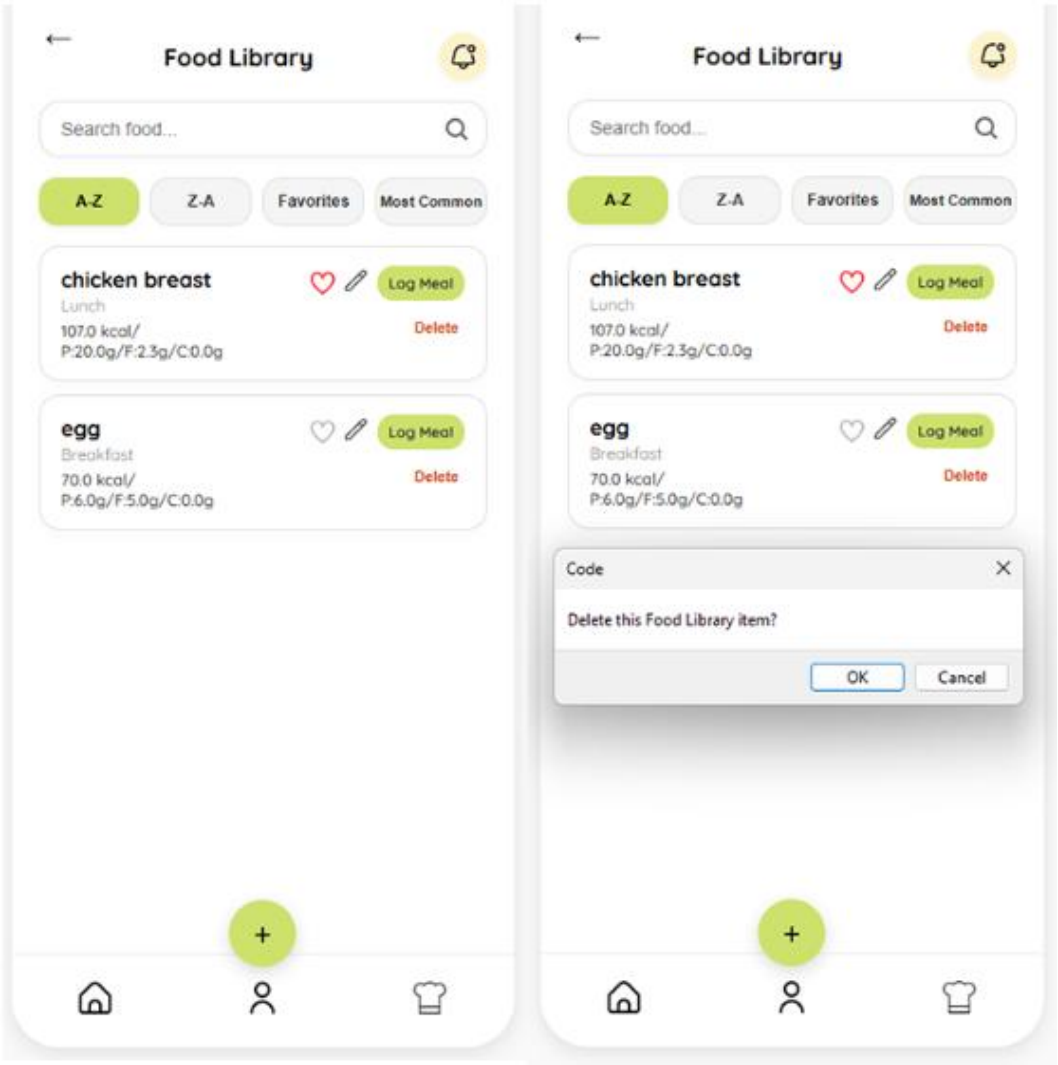

Figure 7. Lifestyle Guru Food Library & Delete-confirmation

Managing Food Items

Food Library items can be organized and reused in several ways. Users can sort stored foods alphabetically, mark foods as favorites, edit existing food information, and remove items that are no longer needed.

To edit a food item, select its **Edit** option, change the desired information, and save the revised values.

To delete a food:

1. Select **Delete** for the desired item.
2. Review the confirmation prompt.

3. Select **Yes** to permanently delete the food.
4. Select **Cancel** to cancel the deletion.

The application also tracks how frequently foods are logged. Frequently used items can appear under **Most Common Foods**, making commonly selected foods easier to find. Foods marked as **Favorites** can also be accessed through the Favorites option.

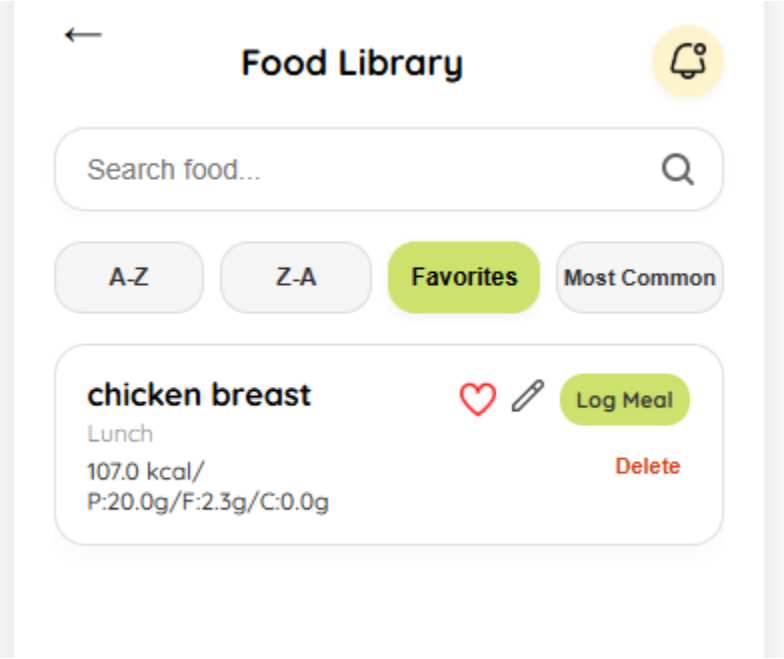

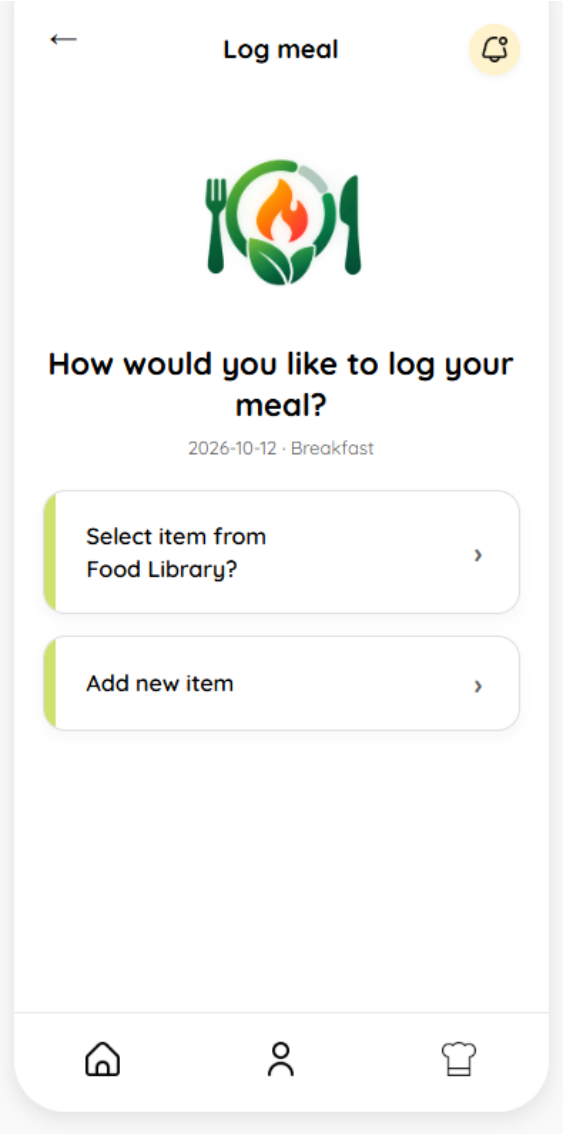

Figure 8. Lifestyle Guru Food Library - Favorites

6. Logging and Managing Meals

Meal logging allows users to record the foods they consume and include those foods in the nutrition totals for a selected date. Lifestyle Guru provides two main meal-entry options: selecting an existing item from the Food Library or creating a new food item.

To log a meal:

1. Open **Log Meal**.
2. Choose **Select Item from Food Library** to use an existing food, or choose **Add New Item** if the food has not been saved previously.
3. Select or enter the food information.
4. Choose the appropriate meal category:
   - Breakfast
   - Lunch
   - Dinner
   - Snacks
5. Confirm the meal information.
6. Save the meal.

The saved meal is associated with the selected date, and its calorie and macronutrient values are added to that day's totals.

Figure 9. Logging a Meal

Editing and Deleting Logged Meals

Previously logged meals can be changed when information was entered incorrectly or removed when the meal should no longer be included.

To edit a logged meal:

1. Logged meals should be edited from Your Daily Menu. Editing a saved item in the Food Library changes the reusable Food Library record but does not update an already logged meal.
2. Locate the meal record.
3. Select **Edit**.
4. Change the required information.
5. Save the revised meal.

To remove a meal, select **Delete** for the desired record. Once a meal is edited or deleted, the application's nutrition totals are recalculated so the daily information reflects the remaining meal records.

7. Calendar and Daily Nutrition History

Lifestyle Guru allows users to review nutrition information for different dates through the calendar and daily-history functions. This makes it possible to view previous nutrition records instead of limiting the application to the current day.

To review a date:

1. Open the **Calendar**.
2. Navigate to the desired date.
3. Select the day.
4. Open the nutrition information for the selected date.
5. Review the meals recorded for that day.
6. Review the total calories, protein, carbohydrates, and fat.

Logged meals are organized into Breakfast, Lunch, Dinner, and Snacks so the user can identify when foods were consumed throughout the day. If no meals were recorded for the selected date, the application will not have meal history to display for that day.

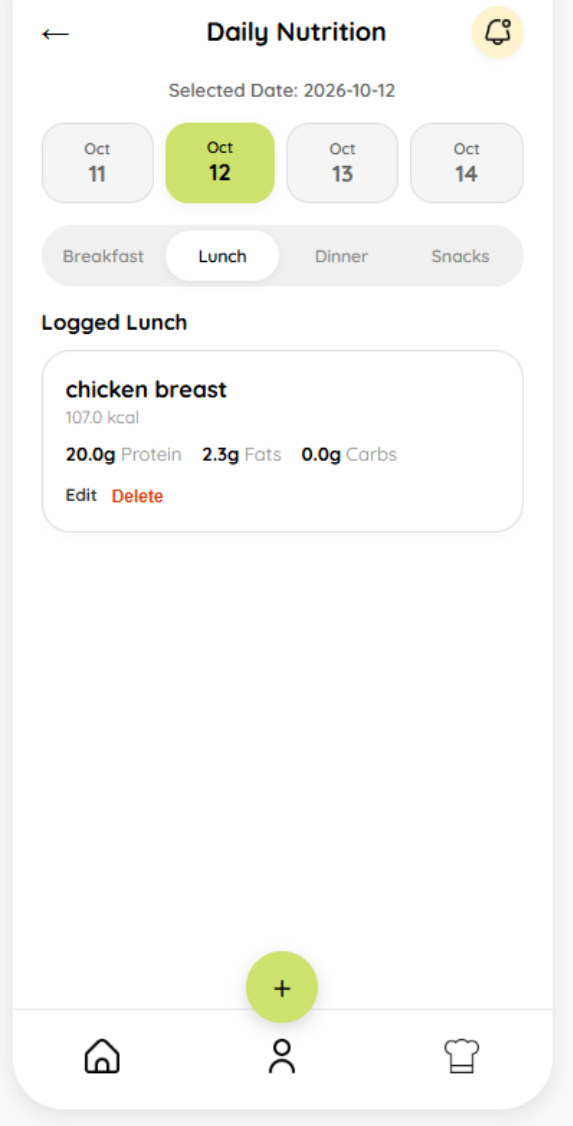

Figure 10. Calendar and Daily Nutrition History

8. Final Version Notes

Lifestyle Guru is provided as a functional course-project prototype. The final version focuses on one active user profile and does not include the originally considered multiple-profile functions. Account access uses simplified validation for demonstration purposes.

The application supports profile management, BMI and BMR calculations, nutrition goals, Dashboard progress tracking, Food Library management, Favorites, Most Common Foods, meal logging, and date-based nutrition history. Some functions have known limitations, such as measurement conversion being limited to initial onboarding

and logged-meal editing being performed through Your Daily Menu. These limitations do not prevent completion of the primary nutrition-tracking workflow.

9. Summary

Lifestyle Guru provides a browser-based environment for managing personal calorie and macronutrient information. This guide explained how to access the application, complete initial profile setup, review and edit profile information, view BMI and BMR values, configure nutrition goals, use the Dashboard, create and manage Food Library items, log and modify meals, and review nutrition information for different dates.

By using the Food Library, meal categories, Favorites, Most Common Foods, Dashboard, and calendar functions together, users can maintain reusable food information and monitor daily nutrition activity in one application. Together, these functions provide the primary calorie- and nutrition-tracking workflow included in the final Lifestyle Guru course-project prototype.
